

Global Change

By: Jose, Abdi, And Alejandro.

What is global change?

Global climate is the average climate in the world.

And change means to make something different.

SOOOOOO When you put these together it means the world climate is changing, and it's getting hotter.

Pollution

Pollution is dangerous, it affects everything from land to water ,air ,noise and more.Harmful substances caused by humans is a huge source of pollution.

One type of pollution

Water pollution- All that dirty water from our house drains through the pipes into river, oceans dirtying the water. Can you imagine all those chemicals from factories draining into the river? How do you kids feel about this?

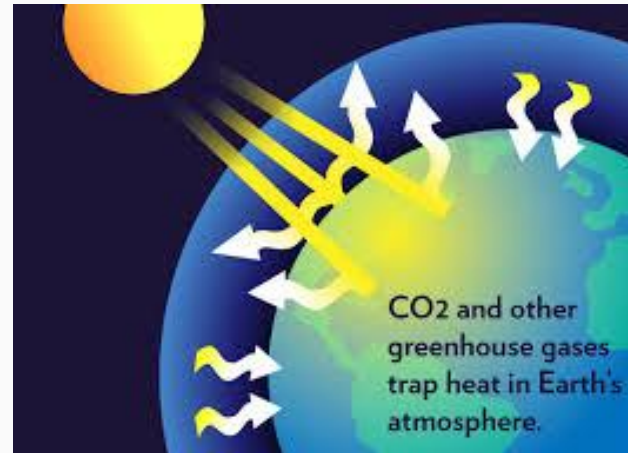

Global warming

Earth's average surface temperature is increasing due to the effect of greenhouse gases. This Makes earth hot.

What are greenhouse gases?

Greenhouse gases are gases that absorb the sun's rays and keeps them close to earth.

Water

Our water supply is decreasing due to these factors. The amount of drinkable water on earth is running out.
